                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 5, Application US/08021623C

Sequence 5, Application US/08021623C

Patent No. 5436149

GENERAL INFORMATION:
TITLE OF INVENTION: Enhanced thermostable DNA polymerase with
TITLE OF INVENTION: enhanced thermostablity and enhanced length and
TITLE OF INVENTION: efficiency of primer extension
NUMBER OF SEQUENCES: 17
CORRESPONDENCE ADDRESS:
ADDRESSEE: Senninger, Powers, Leavitt and Roedel
STREET: One Metropolitan Square, 16th Floor
CITY: St. Louis
STATE: Missouri
COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TICTICAGAATGACTTGGTTGAGTACTCACCAGTCACAGAAAAGCCATCTTACGGATGGCAT

Sequence 1, Application US/09380484A

Sequence 1, Application US/09380484A

Patent No. 6632928

GENERAL INFORMATION:
APPLICANT: Knechtle, Bauar
APPLICANT: Thompson, Jouith M.
APPLICANT: Thompson, Jerry T.
APPLICANT: Hu, Huaizhong
APPLICANT: Hu, Huaizhong
APPLICANT: Hu, Huaizhong
APPLICANT: Ma, Shenglin
ITILE OF INVENTION: IMMUNE TOLERANCE
FILE REFERENCE: 14028.0287

CURRENT APPLICATION NUMBER: 0289/04303

PRIOR PILING DATE: 1999-03-05
PRIOR PILING DATE: 1998-03-05

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1, Ap

The invention describes a targeting vector (positive selection vector)

(I) capable of modifying a target gene. (I) comprises two sequences (S1

(I) capable of modifying a target gene. (I) comprises two sequences (S1

comprising a modification of the target gene which involves introducing (I) into cells capable of homologous recombination, selecting for cells expressing the selectable marker and identifying cells containing the modification of the target gene. Use of (I) for enriching cells compaining the modification of the carget gene. Use of (I) for enriching cells comprising disruption or andlification of target gene enhances recovery of cells having targeting vector integrated via homologous recombination into the genomes of the cells. (I) is capable of modifying target gene in a cell with high efficiency and specificity. Use of (I) provides a faster and more efficient means for isolating and selecting cells comprising targetions endification. Also use of (I) provides an increase over previous technologies in both the speed and frequency at which homologous recombination events can be recovered. (I) is also useful for creation of
                                                                                                                                                                                                            420
    Novel targeting vector modifying target gene, has first and second sequences homologous to target gene portions, a selectable marker cassette and regulator, useful for producing animals with targeted gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Transgenic animal; targeting vector; positive selection vector;

                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nuclectide construct for generating DNA constructs. The nucleotide construct comprises a sequence encoding a positive selection marker flanked by restriction enzyme sites, where restriction site is flanked by sequences which are not complementary to each other and which do not include at least one type of base at any position, where the construct can be treated so that single-stranded regions are created at each sequence lacking at least one nucleotide. The nucleotide construct is useful in a rapid and efficient method for generating DNA constructs suitable for introduction into embryonic stem sequence is plasmid pDG2 vector construct containing an ampicillin resistance gene and neomycin gene (Neo'). On each site of the Neo' gene are two sites for ligation independent cloning along with restriction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   o;

The invention relates to a targeting construct comprising two sequences homologous to a target gene, and a selectable marker; is new. The target gene is a retina-specific unclear receptor gene, a lymphoid-specific GPCR (G protein coupled receptor) gene, a melanocyte stimulating hormone receptor gene, a complex phosphoidseterase gene, chemokine receptor like protein gene, a compression phosphoidseterase gene, chemokine receptor like protein gene, where the mouse exhibits an eye abnormality, callular infiltration, hyposocitve behaviour, lung abnormality, elevated white blood cell count, abnormality in the aorta, kidney, liver, lymph nodes, skin or salivary gland, increased body and organ weight, or callumbin, aggressive, hyperactive, increased activity or decreased anxiety behaviour. The construct is used for introducing targeted anxiety behaviour. The construct is used for introducing targeted anxiety behaviour in construct is used for introducing targeted energy energing the construct is used for introducing targeted into embrayonic cells. The animal and cell-based systems may be used as models for diseases or conditions associated with physiclogical, histological or behavioural phenotypes relating to a disruption in a target gene (e.g. tumours, cancer, retinal degeneration and retinitis gigmentosa) and in screening or identifying compounds capable of physicological or physicological construct of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 480

The present sequence represents vector pDG2. This vector contains an ampicillin resistance gene and a neomycin gene. The vector is used in the invention. The specification describes a non-human transgenic animal comprising a disruption in the matrix metalloproteinase (MMP)-23 gene. Transgenic animals of the invention comprising a homozygous or heterozygous disruption in MMP23 gene are useful for identifying agents which modulate MMP23 expression or function. They are also useful for identifying agents that are capable of ameliorating a phenotype of a transgenic animal comprising a disruption in an MMP-23 gene or ameliorating a disease associated with the phenotype of a transgenic animal model for disease, disorders and conditions characterized by a disruption in a gene encoding a metalloproteinase, more particularly disease, disorders and conditions associated with the phenotypes test substrates for identification of drugs, pharmaceuticals and therapies effective in treating diseases, disorders and conditions test substrates for identification of drugs, pharmaceuticals and therapies effective in treating diseases, disorders and conditions as sociated with the phenotypes cannot be animal is useful for testing and developing new treatments relating to behavioural phenotypes demonstrated by the animal models

Novel nucleotide construct useful for disrupting function of gene in embryonic stem cell, comprises sequence encoding positive selection marker flanked by restriction enzyme sites, to create a single-stranded region.

Claim 10; Fig 2A; 37pp; English.

The present invention relates to a new nucleotide construct comprising a sequence encoding positive selection marker flanked by restriction enzyme sites are flanked by sequences which are not complementary to each other and which do not include at least one type of base at any position, where the construct is treated so that the invention is useful for disrupting the function of a rugle-stranded regions are created at each sequence lacking at least one nucleotide. The invention is useful for disrupting the function of a rugle sequence or gene in a cell e.g. embryonic stem cell, by inserting sequences homologous to the target gene into the construct such that the sequences homologous to the target gene flank the positive selection marker, to produce a targeting construct, and introducing the targeting construct into the cell to produce a homologous recombinant and thus the function of the target gene or sequences is disrupted. The homologous construct into the cell to produce a homologous recombinant and thus the bedienced are sequences flanking the site in the target gene that is to be disrupted. The invention eliminates the need for the traditional the clone and multiple cloning steps. The method of the invention is fast and efficiently generates nucleotide construct, and reduces the time construct making a knock-out vector. Isolating an individual genomic clone or mapping the restriction stees within the clone is not needed for invention is an electricity of stees within the clone; sequence of the invention is ligation independent cloning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence for plasmid vector pDG2 is used as a construct for genes encoding trinucleotide repeat proteins (TRP) such as gene T243 to produce disruption in the DNA. The invention describes methods of producing embryonic stem (ES) calls comprising a heteroxygous disruption in a target DNA sequence (preferably T243) encoding a TRP and of producing a knockout mouse comprising a homoxygous disruption in a gene encoding TRP, where the disruption inhibits the production of the wild type TRP. The invention also relates to identifying agents capable of affecting a phenotype of a knockout mouse. Also described are methods of determining whether expansion of the trinucleotide repeat in a gene encoding TRP produces a phenotypic change. The transgenic animals and the cells are useful for identifying compounds capable of ameliorating disease symptoms, and as test substrates for the identification of drugs, pharmaceuticals, therapies and interventions which may be effective in transferring trinucleotide repeat disorders e.g. fragils K syndrome and Huntington's disease. The animal models for trinucleotide repeat

is so the molecular basis of these diseases and show the features observed in human disease. Using the mice, it is possible to model both

transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection by a carrier system, microinjection, microcell fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a hererologous nucleic acid that encodes a therapeutic product which is useful for making a library of Acce comprising random portions of a genome. ACC44412 to ACC44712 and ABB96650 to ABB96657 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of chromosome. Also described: (I) a platform artificial chromosome carby several sites that participate in recombinate catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a trificial chromosome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachind, or marmal) by introducing (II) by cell fusion lipid-mediated transfection by a carrier system microhid-ction, microcal fusion, electroporation, micropolectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an anti-1 cert immunotoxin. This introduction relates to an anti-1 cert immunotoxin the single chain FV of the variable region of a UCHT1 artibody. The single chain FV of the variable region of a UCHT1 antibody. The single chain FV comprises Vu, i. or VH, L is a Gly-Ser linker, and VL and VH are the variable light and heavy domains of the antibody UCHT1. Also included are a nucleic acid encoding the cover limmunotoxin fusion protein, a vector comprising the nucleic acid and a call comprising the nucleic acid. The immunotoxin may also be a pseudomonas endotoxin A (ETA). The immunotoxins are useful for treating T cell leukaemias or lymphomas, graft-versus-host diseases, and autoimmune diseases by inducing immune tolerance. The immunotoxin fusion proteins or open in vivo to expendically reduce populations of T cells, or exvivo to effect T-cell depletion from a treated cell population. The fusion proteins can be administered to a subject who is or will be a creation of the transplanted alloquence cells, thermapplant rejection of the transplanted alloquence coll cissus or organ in the subject as well as treat other T-cell mediated diseases such as systemic lupus erythematosus, type I diabetes, rheumatoid arthritis, myasthenia gravis, multiple solerosis, infectious diseases of the immune system (e.g. AIDS (acquired immunodeficiency syndrome)) and chronic immunesuppression. The present sequence is a communicatin fusion proteins of the invention construct the immunotoxin fusion proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3357

The present invention describes a eukaryotic chromosome (I) comprising chose or several att sites, where an att site is heterologus to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (Aces) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for artificial chromosome, preferably an ACes. (II) is useful for producing a artificial chromosome, preferably an ACes. (II) is useful for producing a

cloning sites of the vector Litmus p29. The vector is only 3.4 kb in size and can transform both E. coli and Corynebacterium ulcerans and, thus, can be used to produce toxins and mutant toxins. In addition, the invention provides a mutant Pichia pastoris, a method for producing this mutant and a method of expressing engineered toxin mutants and toxin fusion proteins in the mutant PP pastoris. The invention further provides a mutant GHO cell, a method for producing these a mutant GHO cell, a mutant insect cell, a method for producing these mutants and a method of expressing engineered toxin mutants and toxin fusion proteins in the mutant cells. Methods are claimed for expressing adiphtheria toxin or a Pseudomonas exotoxin A toxin in the mutant cells. The invention results in higher fusion protein secretion than prior art methods, thus eliminating the need for refolding, and providing glycosylated immunotoxins that are useful for in vivo clinical application. (Updated on 17-0CT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     pCE96; ds; immunotoxin; pseudomonas exotoxin A; ETA; diphtheria toxin; DT; cytostatic; immunosuppressive; immunostimulant; antidiabetic; antiarthritic; anti-HIV; anti-inflammatory; anti-Treul immunotoxin fuelain protein; antibody; UCHH; FV; CD3; T cell leukaemia; lymphoma; graft-versus-host disease;

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antiense RNA, trNA, rDNA, structural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and conting proteins, antiportions, vaccines, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (MAC) or a yeast artificial chromosome (MAC). This polynucleotide sequence represents the DNA of a plasmid used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               rrrrdcceccarrrrccrrrrrrdcrcaccagaaaccrrcaaaaacaraaaaaa 480

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠે
                       The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologues to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (ACEB) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (M1) for introducing a heterologous nucleic acid into a platform artificial chromosome, (I) can be used in gene therapy. (M1) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACE. (II) is useful for producing a riticial chromosome, preferably an ACE. (II) is useful for producing a riticial chromosome, preferably an ACE. (II) is useful for producing a mammal) by introducing (II) by cell fusion, lipid-mediated transfection, by a carrier system, microinjection, microcall fusion, electroporation, cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for complete acid that encodes a therapeutic product which is useful for comprise and apple6500 the present invention of a genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         300

The specification describes a method of determining the quantity of a target RNA in a tissue sample. The method comprises reverse transcribing target RNA from the tissue and then amplifying the cONA, binding a labelled sequence corresponding to an internal sequence complementary to one of the strands of the target RNA product, and determining the amount of labelled RNA bound to the amplified target DNA. The method is used to quantify more accurately the amount of target RNA in a sample

chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection microprojectile system, microinjection, microcall fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome. ACC44612 to ACC44732 and ABD96650 to ABP96657 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               240

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits sites thered integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (ACes) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for introducing an heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, archnid, or mammal) by introducing (II) by cell fusion, liptid-mediated transfection microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome. Also described. (I) a platform artificial chromosome expression system (Aces) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel eukaryotic chromosome comprising one or many att sites which permits site-directed integration in the presence of lambda-integrase, useful for site-specific recombination-directed integration of DNA of interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Leung J,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vector pLITMUS 38 nucleotide sequence SEQ ID NO:119.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Perez C, Lindenbaum M, Greene A, Shellard J;
